                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A hybrid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant is a Asn271 deletion mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.

IgG1-IgG4, IgA, IgE, IgD or IgM. The fusion product is joined by N- or C-terminal groups, preferably the N-terminal of the Fc region of the spp is linked to the C-terminal of lbp. They may be used to provide antiviral, immunomodulatory and neuromodulatory treatment as well as in treatment of receptor

an EGF-like domain, a complement binding domain and a transmembrane domain. The protein contains 26 cystein residues. Cells transformed by the hLHR DNA are used to produce LHR (which mediates binding of lymphocytes to the endothelium of lymphoid tissue). LHR or its variants are useful as reagents for assaying LHR or anti-HR anti-bodies, to purify the antibodies, as immunogens, and therapeutically to compete with normal binding of lymphocytes (to prevent graft/organ rejection; to treat inflammation (such as rheumatoid arthritis or other autoimmune diseases); for control of lymphocyte metastasis, and to treat conditions associated with accumulation of lymphocytes). Derivs. and variants of LHR may be produced having modified properties, e.g. increased activity, longer plasma half-life,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The protein sequence was deduced from the DNA sequence obtd. by screening an oligo dT primed lambda gtl0 cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells, with a 2.2 kb EcoRI insert of the murine Mel 14 antigen cDNA clone. The protein contains regions encoding a carbohydrate binding domain,
Lyphocyte cell surface glycoprotein; ligand binding protein

                                                                                                                                                                                         LHR mediates the binding of lymphocytes to the endothelium of lymphoid tissue. Full length cDNA clones and DNA encoding the human and the murine LHR (HuLHR and MLHR, respectively) have been identified and isolated (see AAQ24987 and AAQ24989). LHR is glycoprotein which contains the following protein domains: a signal sequence, a carbohydrate binding domain, and epidermal growth factor-like (egf) domain, at least one and preferably two complement binding domain repeat, a transmembrane binding domain (TMD), and a charged intracellular or cytoplasmic domain. LHR is used as the ligand-binding partner in fusion polypeptides with an immunoglobulin,

```

A human peripheral blood lymphocyte cDNA library in lambda gt10 was screened with a 2.2kb EcoRI insert of the murine Mel14 antigen clone (i.e. a murine LHR sequence). The largest EcoRI insert (2.2kb) was isolated and sequenced. The ORF codes for 372 amino acids with a mol. wt. of approximately 42,200. Comparison of the HuLHR amino acid sequence with the murine LHR sequence (AAR37961) showed a high degree

lymphocyte mediate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of amino acid conservation in each of the LHR domains, e.g. 96% in the transmembrane domain and 83% in the carbohydrate binding domain. The LHRs could be used to compete with the normal binding of lymphocytes to lymphoid tissue to treat inflammation or graft rejection. They could also be used to control lymphoma metastasis and to treat conditions involving lymphocyte accumulation.

These proteins mediate the binding of lymphocytes to the endothelium of lymphold tissue. LHR is a glycoprotein which contains a signal domain, a carbohydrate binding domain, an epidermal growth factor-like (egf) domain, at least one complement binding domain repeat, a transmembrane binding domain (TMD) and a charged intracellular or cytoplasmic domain. The murine and human amino acid sequences show a high degree of overall homology (83%), however degrees of homology between the various domains is variable. These proteins may be fused to a ligand binding partner protein (LBPP) which causes an increase in the half life of the LHR. The fusions may be caused therapeutically to compete with the normal binding of lymphocytes to lymphoid tissue. They may be used in organ or graft rejection and for the treatment of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

Human lymphocyte cell surface glycoprotein
                                                                                                                                                                                                                                                                                                                                  A mouse LHR (lymphocyte cell surface glycoprotein) cDNA clone was used to screen an oligo-dT primed lambda gtl0 cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells. A 2.2 kb clone (sequence given in AAT05869) was isolated that encoded the human LHR protein (AAR83050). LHR-IgG hybrids were constructed for use in the targeting of therapeutic moieties to lymphoid tissue.

```
immunoglobulin super family, nor a multiple subunit polypeptide
cencoded by discrete genes. The hybrid immunoglobulin chain combines
the adhesion/targetting of a ligand binding partner (LBP) with the
effector functions of immunoglobulin and can bind to and/or activate
concretant one ligand. It can be used diagnostically for the in
cylitro assay of LBP and their targets; or therapeutically to deliver
LBP such as toxins, enzymes, growth factors to particular cells.
Typical applications are as antiviral, neuromodulating and
immunomodulating agents, or as modulators of cell adhesion (e.g. in
treating graft rejection; inflammation; metastasis of lymphoma etc.)
The immunoglobulin component increases plasma half life and
facilitates purification while deletion of the transmembrane region
facilitates recovery, improves aqueous solubility and removes
contentially immunogenic epitopes.

region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver
                                                                                                                                                                                                                                                                            22-NOV-1989;

Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a 209-Asn insertion.

This can be used for the prevention of lymphocyte attachment to endothelial cells. Such a method may be used for preventing organ or graft rejection, for treating inflammatory disorders, e.g. rheumatoid arthritis or other

LHR is a lymphocyte cell-surface glycoprotein that mediates the binding of lymphocytes to the endothelium of lymphoid tissue. Soluble LHR polypeptides, lacking signal peptide (amino acids 1-38), transmembrane domain (amino acids 333-355) and cytoplasmic domain (amino acids 356-372), can be used therapeutically to compete with the normal binding of lymphocytes to lymphoid tissue and are especially useful for organ or graft rejection treatment protocols, for treating inflammations such as arthritis and other autoimmune diseases, for control of lymphoma metastasis and for treating conditions involving lymphocyte accumulation. LHR polypeptides can also be used in assays for LHR, anti-LHR antibodies or competitive inhibitors of LHR activity, and for purifying anti-LHR antibodies.
                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin; transmembrane receptor; adhesion; targetting; diagnosis; therapy; drug delivery; antiviral; neuromodulator; immunomodulator; cell adhesion; graft rejection; inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           communication super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in the control of the same of their targets; or therapeutically to deliver the control assay of LBP and their targets; or therapeutically to deliver the control applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and capilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in the control of the control of the immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in

The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation, metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery immoves account account of the transmembrane region

```
immunoglobulin super family, nor a multiple subunit polypeptide
cencoded by discrete genes. The hybrid immunoglobulin chain combines
the adhesion/targetting of a ligand binding partner (LBP) with the
effector functions of immunoglobulin and can bind to and/or activate
more than one ligand. It can be used diagnostically for the in
vitro assay of LBP and their targets; or therapeutically to deliver
LBP such as toxins, enzymes, growth factors to particular cells.
Typical applications are as antiviral, neuromodulating and
immunomodulating agents, or as modulators of cell adhesion (e.g. in
treating graft rejection; inflammation; metastasis of lymphoma etc.)
The immunoglobulin component increases plasma half life and
facilitates purification while deletion of the transmembrane region
facilitates recovery, improves aqueous solubility and removes
potentially immunogenic epitopes. Variants of the human lymphocyte
cell surface glycoprotein described in AAR98106 are given in
AAR98109-R98135. This variant contains a 241-Val-Glu-Asn insertion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a 292-Tyr-Tyr-Tyr insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human lymphocyte cell surface glycoprotein (HuLHR) variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunoglobulin; transmembrane receptor; adhesion; targetting;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 CQPWSCSGHGECVEIINNHTCNCDVGYYGPQCQL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C effector functions of immunoglobulin and can bind to and/or activate vitro assay of LBP and their targets; or therapeutically to deliver C vitro assay of LBP and their targets; or therapeutically to deliver C LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile174Leu substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                      effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogencie epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R08135. This variant contains an Asn181Gh substitution.
                                             Human lymphocyte cell surface glycoprotein (HuLHR) variant.

                                                                                                                  AAR98114;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   region, fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22-NOV-1989;

                                                                                                                                                                                 Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an His168Cln substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                           immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver
                                                                                                                                      Sequence

                                                         CC regulation of cellular proliferation. The compound comprises, a control of call and a nucleotide cyclic-3'-5' monophosphate attached to the linker group through a heterocyclic base. The bifunctional compounds can be used for regulating cell proliferation, cell adhesion and cell compounds can be used for treating e.g. tumours, neoplasty, cancer or inflammation. They can also be used to serve as immunosuppressants in corratin applications such as organ or tissue transplantation, as control of compounds can be used for provide immunosuppressants in corration and growth for new tissue. This can be useful in the repair can control and growth for new tissue. This can be useful in the repair control and growth for new tissue. This can be useful in the repair control and control of artificial tissue into the body. This can have beneficial effects in the treatment of burns or other replacement control are growth. The present sequence represents a human L-selectin control and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

                     Two cDNA clones encoding Leu8 determinants were isolated from a human T cell library using the rapid immunoselection cloning method (see e.g. AAQ21164 for description of method). This protein sequence was deduced from the shorter insert. The weakly hydrophobic C-terminal domain is characteristic of surface proteins that are
attached to the cell membrane by phosphatidylinositol-substituted
                                                                                          Example
                                                                                                                 New CD53 cell surface antigen and DNA encoding it - for immuno-therapy and diagnosis of haematopoietic neoplasms,
                                                                                                                                                                                                                                  13-JUL-1990;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cloning method. The longer insert (AAT14723) contained 2,350 residues, while the shorter lacked 436 internal residues. A major transcript of 2.4 kb was present in peripheral blood mononuclear cells (PBMC), tonsillar B cells, and several lymphocytic cell lines, and a minor transcript of 2.0 kb in PBMC, Jurkat and HSB-2 leukaemic T-cell lines. Leu8 antigens can be obtd. For diagnostic and therapeutic use. The presence or absence of Leu8 on CD4+ T-cells identifies suppressor-inducer and helper-inducer CD4+ T-cell subsets. Soluble forms of Leu8 can act as antiinflammatory agents by reducing
The present sequence is that of a T-cell specific Leu8 antigen, as predicted from 1 of 2 clones (see AAA50632) isolated from a human T-cell library by the method of the invention. A longer Leu8 antigen is given in AAY96138. The method, designed to isolate cell surface antigen (CSA) cDNAs, is based upon transient expression of a CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate
                                                                                                                                                                                                                                                                                                  Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasitic

                                                                                                                                                                                                                                asthma, immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. The ability to interfere with the binding of Leu8-T-cells to antigen presenting cells, or the ability to cause such binding to occur on surfaces other than lymphocyte cells, can be useful in diagnostics and therapy. The level of activated Leu8-T-cells relative to resting Leu8+ cells could serve as a measure of immune response to a particular antigen. Modification of the specificity of the extracellular domain of Leu8, which mediates adhesion to specific endothelial cells of lymph nodes, could serve to regulate the homing potential of resting T cells. Soluble forms of Leu8 could act as antiinflammatory agents by reducing lymphocyte
